

GeoHay

Solutions

Airports

Location: Dallas Love Field, Dallas, Texas

Application: During the demolition of several buildings which were outdated and needed to be removed to make room for new spaces, GeoHay was used to keep the demolition debris from running off the site and into the stormwater system. GeoHay had a three fold advantage: GeoHay could be moved from one demolition site to another without having to be replaced and lasted the length of the entire project; The product could be installed on the asphalt with rock bags for easy installation; GeoHay's fibers would not be taken up into the airplane engines as is prone with some other BMP's.

Outcome: The demolition crew was pleased with the ease of installation and reusability of the product as they moved from building to building for demolition. Due to the extreme sensitivity of the demolition and the surroundings, GeoHay was a good fit for the project.
